INTERFACES

The Instant key is an exclusive, touch-based tool for animating on-air using a partial auto-realisation mode, allowing the producer to act on the host's GUI interface, and can be displayed on an HTML interface.

Both static and dynamic sound element pages are customizable.

Ip-ike4 also features a quick search engine for each letter typed.

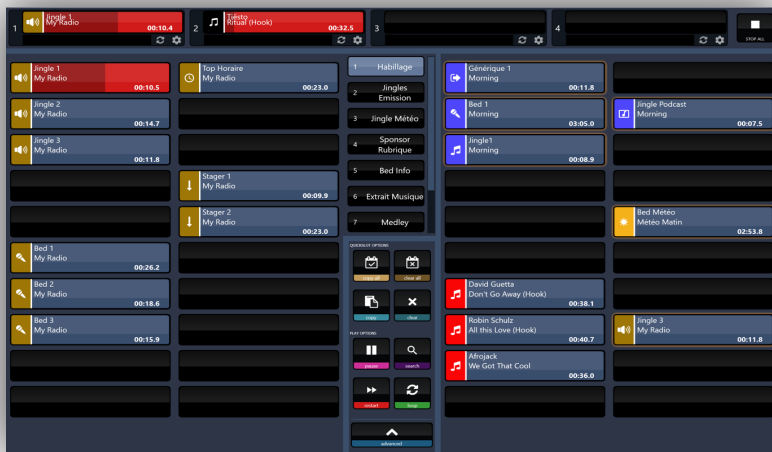

MULTIPLAY

Multi-Play is an audio player with a wide range of possibilities for sound distribution.

Multi-Play Antenna can be tailored to your production needs, allowing single or simultaneous playback of multiple sound elements, as well as single or multi-channel playback.

Each action adapts to your preferences (play, stop, replay, loop, search).

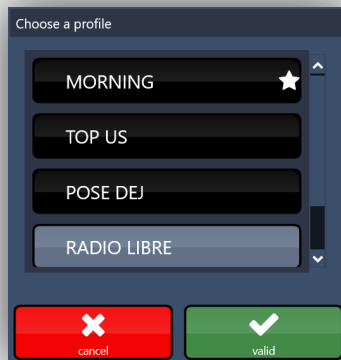

SOUND BANK

Ip-ikey features a multitude of sound banks, comprising an indefinite number of pages named and organized according to need, with customizable icons and colors for enhanced visual comfort.

It is possible to access and manage rights to banks of 20 sound elements, as well as to build your own static bank live.

Thanks to the solution's performance, update management is simplified for the user, who is alerted in real time from production and can carry out updates remotely.

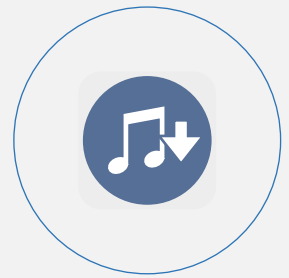

CONTENT EDITING

The ip-ikey module enables complete and efficient content editing. It can be used to edit remarkable points, or to name content in order to help the presenter find his or her bearings.

Ip-ikey features precise audio correction tools, graphically visible thanks to a bar graph and sound waveforms.

This considerable range of editing tools can be customized, as can the identification of content by selected icons, enabling users to create their own aesthetic rendering.

SIMPLIFIED AUDIO FILE ADDITION

Importing audio is simplified by the drag & drop function, and can be dropped into a bank of your choice, as well as used immediately after import.

To make things even easier for the user, ip-key features built-in normalization, which automatically resolves sound problems.
